

ABSTRACT

A liquid ejecting apparatus etc. creating no blank space on a medium is achieved. The liquid ejecting apparatus has: a
5 movable ejection head for ejecting a liquid; a feed mechanism for feeding a medium; and detecting means for detecting a position of an edge of the medium; wherein the apparatus repeats an operation of detecting the position of the edge with the detecting means, an operation of feeding the medium with the feed mechanism, and
10 an operation of ejecting the liquid onto the medium from the moving ejection head; in accordance with the position of the edge that has been detected, the apparatus changes at least either one of a start position and an end position for ejecting the liquid from the moving ejection head; and if the position of the edge was not
15 detected, the apparatus sets the start position or the end position to a position that has been established in advance.
